FOUNDATION

About NAIOP

NAIOP, the Commercial Real Estate Development Association, is the leading organization for developers, owners and related professionals in office, industrial, retail and mixed-use real estate. NAIOP comprises some 20,000 members in North America. NAIOP advances responsible commercial real estate development and advocates for effective public policy. For more information, visit naiop.org.

The NAIOP Research Foundation was established in 2000 as a 501(c)(3) organization to support the work of individuals and organizations engaged in real estate development, investment and operations. The Foundation's core purpose is to provide information about how real properties, especially office, industrial and mixed-use properties, impact and benefit communities throughout North America. The initial funding for the Research Foundation was underwritten by NAIOP and its Founding Governors with an endowment established to support future research. For more information, visit naiop.org/researchfoundation.

About Dodge Data & Analytics

Dodge Data & Analytics is the leading provider of data, analytics, news and intelligence serving the North American construction industry. The company's information enables building product manufacturers, general contractors and subcontractors, architects and engineers to size markets, prioritize prospects, target and build relationships, strengthen market positions and optimize sales strategies. The company's brands include Dodge, Dodge MarketShare™, Dodge BuildShare®, Dodge SpecShare® and Sweets. For more information, visit construction.com.

About the Leeds School of Business

Formed in 1906, the Leeds School of Business is the eighth-oldest business school in the United States. As part of the University of Colorado, the Leeds School embraces the university's research and teaching mission with prominent faculty teaching 4,400 undergraduate and graduate students in accounting, finance, marketing and management degree programs.

The Business Research Division (BRD), a center within the Leeds School of Business, was formed shortly after the school came into existence. Continuing with the inaugural mission, the BRD conducts applied industry and economic research for multiple constituencies external to the school. Faculty and staff who contributed to this report have extensive experience in conducting real estate and economic research. The project team included Brian Lewandowski, Executive Director of the Business Research Division; Richard Wobbekind, PhD, Faculty Director of the BRD and Associate Dean for the Leeds School of Business; Michael P. Kercheval, PhD, Executive Director, CU Real Estate Center; and Jacob Dubbert, Research Economist with the BRD. For more information about the project team or the Business Research Division, visit: colorado.edu/business/brd.

Disclaimer

The data collection measures included in this report should be regarded as guidelines rather than as absolute standards. The analysis was completed in December using partial year data. The data may differ according to the geographic area in question, and results may vary accordingly. Local and regional economic performance is a key factor. Further study and evaluation are recommended before any investment decisions are made. This report is intended to provide information and insight to industry practitioners and does not constitute advice or recommendations. NAIOP disclaims any liability for action taken as a result of this project and its findings.

Introduction

Since 2008, NAIOP has conducted this study to estimate the annual economic contribution of commercial real estate development to the U.S. economy. The study uses key data sets from the U.S. Census Bureau, U.S. Bureau of Labor Statistics, the Bureau of Economic Analysis and Dodge Data & Analytics. It applies several estimating and impact-assessment methodologies to take snapshots of the commercial real estate development industry from various perspectives. **The study includes an analysis of the economic contributions of new commercial real estate development and existing commercial building operations and compares these contributions to the broader economic contributions of all building and nonbuilding construction, which includes infrastructure, residential and government building construction.** The study’s methodology has been updated since the 2021 report, resulting in minor differences in the estimation of some economic contributions (see Methodology on page 20).

The combined economic contributions of **new commercial building development and the operations of existing commercial buildings in 2021** (see Tables 2 and 3 on pages 3 and 4) resulted in direct expenditures of \$434 billion and the following impacts on the U.S. economy:

- Contributed \$1.2 trillion to U.S. gross domestic product (GDP);
- Generated \$418.7 billion in personal earnings; and
- Supported a total of 8.5 million jobs.

Building and Nonbuilding Construction. The broadest measure taken calculates the contribution of building and nonbuilding construction to the U.S. economy for the year in review. The product types include residential, nonresidential and infrastructure projects in the construction pipeline, based on U.S. Census data on the value of construction put in place. The most recent multipliers from the U.S. Department of Commerce’s Bureau of Economic Analysis (BEA) and IMPLAN are applied to reflect the effects of construction expenditures on U.S. GDP and the jobs supported by these direct expenditures (Table 1).

TABLE 1

Economic Contributions from Building and Nonbuilding Construction, 2012–2021

Year	Direct Expenditures (In Billions of Dollars)	Total Economic Contribution to GDP (In Trillions of Dollars, Includes Multiplier Effect) ¹	Percent Contribution to GDP	Jobs Supported (In Millions, Includes Multiplier Effect) ²
2021	\$1,561	\$4.2	18.3%	28.5
2020	1,469	4.0	19.1%	26.8
2019	1,391	3.8	17.6%	25.3
2018	1,277	3.6	18.6%	26.0
2017	1,248	3.4	18.2%	24.0
2016	1,160	3.2	18.3%	23.8
2015	1,104	2.9	17.9%	22.7
2014	993	2.8	16.6%	20.4
2013	911	2.7	16.7%	21.3
2012	857	2.3	16.3%	20.1

¹ The total value of goods and services generated directly and indirectly as a result of construction and related expenditures within the U.S.

² The jobs supported by the spending and re-spending of direct expenditures for all phases of development and operations.

Note: 2019 and 2020 values are revised, 2021 is estimated.

Development of New Commercial Real Estate Buildings.

One subset of total construction is commercial real estate — the focus of this study. The analysis begins with Dodge Data & Analytics data relating to square footage and construction values for office, industrial, warehouse and retail projects. In contrast with the BEA, Dodge Data & Analytics measures a building's full construction value and square feet when the project breaks ground (starts), not when it is completed. These data provide the foundation for estimating expenditures made during four distinct phases of the development process: preconstruction (soft costs), site development, on-site construction (hard costs) and tenant improvements (financing fees, insurance and taxes are not included in this analysis within the soft construction costs category because they have little immediate economic impact). This study also examines the contribution of building operations that are reported as a stand-alone phase that follows development. Additionally, it shows the impacts for the estimated 733 million square feet of commercial buildings that commenced construction over the past year, according to Dodge Data & Analytics.

Multipliers are applied to the direct expenditures to calculate the contribution to U.S. GDP, personal earnings and jobs supported during each distinct development phase. Residential and hotel properties and government buildings are not included in these calculations (see Table 2 on page 3).

The full measure of the economic impact of office, industrial, warehouse and retail development includes all expenditures associated with each phase of the development process. In addition to the wide range of on-site construction services, these expenditures also support professional and business services, including:

- Architecture and engineering services;
- Legal services;
- Marketing and management services;
- Grading, paving and landscaping services;
- Site engineering services; and
- Interior design and construction services.

The combined spending for preconstruction, construction and post-construction activities required to deliver buildings ready for occupancy represents the development industry's total direct contribution to national, state and local economies. It provides the appropriate basis for calculating the economic impacts of this spending as represented by its contribution to GDP, personal earnings (wages and salaries) and employment.

Existing Inventory of Commercial Real Estate Buildings.

This study also includes the economic contributions of existing buildings. Based on the existing stock of commercial buildings—totaling 51 billion square feet at the end of the third quarter of 2021—direct expenditures for building operations totaled an estimated \$194.5 billion and contributed \$531.5 billion to GDP. These direct expenditures also generated \$187.2 billion in personal earnings (wages and salaries) and supported 4.2 million jobs (see Table 3 on page 4).

TABLE 2

Economic Contributions to the U.S. Economy from Development of Commercial Real Estate Buildings, 2016-2021

	Development Phases				Totals	Operations Phase
	Pre-Construction	Construction				Post-Construction
	Soft Construction (Soft Costs)	Site Development	Hard Construction (Hard Costs)	Tenant Improvements		Building Operations
	architecture, engineering, legal, marketing, management, administration	grading, paving, landscaping, roadway, parking, off-site improvements	labor, materials, construction management	interior design and construction (excludes furniture and equipment)		maintenance, repairs, custodial, utilities, property management
Direct Expenditures (In Billions of Dollars)						
2021	\$34.07	\$34.47	\$125.59	\$45.65	\$239.79	\$1.69
2020	29.06	28.23	105.63	38.52	201.43	1.88
2019	39.21	34.49	134.85	46.31	254.87	2.02
2018	31.71	27.88	109.01	38.27	207.77	1.76
2017	28.58	24.73	98.55	35.23	187.09	1.66
2016	25.06	21.42	82.96	30.6	160.04	1.42
Total Economic Contribution to GDP (In Billions of Dollars, Includes Multiplier Effect) ¹						
2021	\$95.37	\$93.45	\$340.47	\$123.76	\$653.04	\$4.61
2020	81.33	76.52	286.36	104.41	548.63	5.04
2019	109.76	93.50	365.57	125.55	694.38	5.41

¹ The total value of goods and services generated directly and indirectly as a result of construction and related expenditures within the U.S.

² The additional earnings (wages and salaries) generated from construction and related expenditures.

³ The jobs supported by the spending and re-spending of direct expenditures for all phases of development and operations.

Note: Building operations include maintenance repair, cleaning, utilities, security, building management, and administrative expenses; see Appendices for state and building type data.

Economic Contributions

Building and Nonbuilding Expenditures

In March and April 2020, the construction industry lost 1.1 million jobs, or 14.6% of employment; by November 2021, it added back 1 million jobs, leaving a deficit of 115,000 (1.5%) from the pre-recession peak. Aside from the impact on labor, the construction industry at large was spared the impact from the pandemic recession. Nearly 1.5 million residential building permits were issued in 2020—the highest number since 2006 and the 11th consecutive annual increase in permits. Overall value of construction put in place increased 5.6% in 2020, posting the fastest

growth since 2016. Similar to the broader economy, though, construction subcomponent performance varied widely in 2020. The value of residential construction put in place increased 15.3%, but nonresidential values decreased 1.2%¹; the subsectors of public safety and health care construction increased 48.8% and 4%, respectively, in 2020, while manufacturing and lodging decreased 10.9% and 13.2%. Disparities continued into 2021—data year-to-date through October show residential increased 23.8%, manufacturing increased 2.8% and retail increased 1.9%; while public safety decreased 32.5% and lodging decreased 31.9% (Table 4).

TABLE 4

Nonresidential Construction Spending, 2019, 2020 and 2021

Type of Structure	Spending (In Billions of Dollars)			Spending (In Billions of Dollars)		
	2019	2020	Percent Change 2019-2020	YTD October 2020	YTD October 2021	Percent Change 2020-2021
Transportation	\$57	\$60	3.9	\$50.0	\$47.0	-6.0
Health Care	46	48	4.0	40.4	40.6	0.5
Retail	84	87	2.9	73.4	74.7	1.9
Manufacturing	81	72	-10.9	60.7	62.5	2.8
Amusement/ Recreation	30	28	-9.4	23.3	21.0	-9.9
Education	109	107	-1.4	91.9	83.4	-9.2
Public Safety	12	18	48.8	15.3	10.3	-32.5
Office	89	87	-1.5	74.3	68.4	-7.9
Religious	4	4	-6.2	2.9	2.5	-13.7
Lodgings	33	29	-13.2	24.9	17.0	-31.9
Total	\$546	\$540	-1.2	\$457.3	\$427.5	-6.5

Sources: U.S. Census, Annual Value of Construction Put in Place 2009 – 2020, https://www.census.gov/construction/c30/historical_data.html, retrieved November 2, 2021.

Note: Totals include some miscellaneous state and local government buildings but exclude spending for nonbuilding construction on items relating to communication, power, highway and street, sewage and waste disposal, water supply, and conservation and development.

¹ Excluding communication, power, highway and street, sewage and waste disposal, water supply, and conservation and development.

Construction Activity in Long-Run Expansion. During the economic expansion (mid-year 2009 to February 2020), the growth of total construction spending exceeded the GDP growth rate each year beginning in 2011, gaining 65% from June 2009 to February 2020 (Figure 1). For comparison, nominal GDP grew 49% from Q2 2009 through Q1 2020, and real (inflation-adjusted) GDP grew 25%. As of October 2021, total construction spending was up 8.6% year-over-year, while nominal GDP grew 9.7% year-over-year in Q3 2021, and real GDP grew 4.9%.

The value of **nonresidential construction** declined 1.2% in 2020 and 6.5% year-to-date through October 2021 when compared with the same period in 2020.² This decrease in nonresidential construction value reflected a mixed performance among the building categories, as shown in Table 4. This is consistent with the differential impacts on those sectors of pandemic-related shutdowns and lost business. Lodging, public safety, religious and amusement and recreation

were among the building types that experienced the greatest declines in year-to-date construction spending in 2021. Manufacturing, commercial and health care posted gains. Although down from 2020, nonresidential construction spending stabilized over the first 10 months of 2021.

Residential construction spending gained 23.8% for the 12-month period ending in October 2021, effectively reaching record levels in nominal values. For 2021, projections show that residential permits will total 1.58 million units,³ up nearly 15% from 2020, marking the most production since 2006 (see Figure 2 on page 7).

The construction industry was deemed an essential business in most areas of the country, allowing for continued production despite the pandemic. Personal income increased during the pandemic, meaning that consumers could continue to make mortgage and rent payments; and even as federal stimulus waned,

FIGURE 1: VALUE OF CONSTRUCTION, 2009-2021

Source: U.S. Census Bureau, Value of Construction Put in Place (seasonally adjusted).

Note: Nonresidential excludes communication, power, highway and street, sewage and waste disposal, water supply, and conservation and development.

² Excluding communication, power, highway and street, sewage and waste disposal, water supply, and conservation and development.

³ Consensus Forecasts, November 2021.

FIGURE 2: NEW PRIVATELY OWNED HOUSING UNITS STARTED, 2000-2021

Source: U.S. Census Bureau, *New Privately Owned Housing Units Started*. 2021 projected from Consensus Forecasts.

personal income from employee earnings rebounded and spiked to record levels. The industry also surged during the pandemic recession as mortgage rates remained at historically low levels—rates decreased in 2021 but are expected to increase in 2022, posing downside risk for the industry. Demographics are also favorable for residential demand as millennials continue to transition to homeownership (and even second homes).

Building and Nonbuilding Construction, Output Multipliers, GDP, and Employment. Based on U.S. Census data, the estimated total value of building and nonbuilding construction spending put in place in the U.S. in 2021 was nearly \$1.6 trillion. This construction spending directly accounted for 6.7% of the nation’s third-quarter estimated GDP of \$23.2 trillion in 2021. With an output multiplier of 2.71⁴, each \$1 of construction spending generated a total value of \$2.71 to the economy, reflecting the cumulative effects of the initial construction expenditures as they cycle throughout the economy. Applying this multiplier to the total value of direct construction spending in 2021 brings the value of its overall contribution to GDP—direct, indirect and induced—to \$4.2 trillion, which accounted for 18% of all U.S. economic activity in 2021. Industry spending also directly and indirectly supported 28.5 million jobs in the economy.

⁴ The Nonresidential structures multiplier was sourced from IMPLAN. The state-level multipliers were sourced from the Bureau of Economic Analysis.

The Bottom Line: In 2021, the \$1.6 trillion in building and nonbuilding construction spending contributed \$4.2 trillion to U.S. GDP and supported 28.5 million jobs.

Office, Industrial, Warehouse, and Retail Development Expenditures

Construction data provided by Dodge Data & Analytics for office, industrial, warehouse and retail buildings provide a more refined definition of construction expenditures (hard costs) over time. As presented in Table 5 on page 8, total construction expenditures (hard costs) for these four building types in 2021 totaled \$125.6 billion, up \$20 billion, or 18.9%, from the revised annual total for 2020.

Office construction expenditures averaged \$46 billion over the past five years (2016-2020). Office activity totaled \$40.9 billion in 2021, down 5.9% from 2020 and down 24.9% from 2019.

Industrial (manufacturing) construction expenditures averaged \$25.6 billion over the past five years (2016-2020). Industrial activity totaled \$28.2 billion in 2021, up 81.3% from 2020 (\$15.5 billion) but down 16.3% from 2019.

Warehouse construction outlays averaged \$26 billion over the past five years (2016-2020). Warehouse activity surged 25.9% in 2021 to total \$43.2 billion. Activity was up 43% from 2019.

Retail construction expenditures averaged \$17 billion over the past five years (2016-2020). After decreasing 26% in 2020, retail posted a rebound in 2021, increasing 8.3% to \$13.3 billion. Retail activity remained down 19.5% from 2019.

Square Footage and Expenditures (All Structures Combined). The total amount of new construction in 2021, as measured in square feet for these four building types, increased by 99 million square feet (15.6%) from revised year-end construction data for 2020 (Table 6). A continuing change in the mix

of building types affected the square footage of new construction in 2021. Warehouses accounted for 69% of all new space built in 2021, up from 63% in 2020 and 24% in 2011. As warehouse space increased in the share of activity, the other three building types decreased. Retail space has seen its share decrease from 32% of the total square footage in 2011 to 9% in 2020 and 8% in 2021; industrial fell from 21% in 2011 to 10% in 2021; and office declined from 23% in 2011 to 18% in 2020 and 14% in 2021.

Due to differences in construction costs per square foot for different building types, the patterns of construction value by building type present a somewhat different distribution, as shown in Table 6. Office construction value decreased its share (41% to 33%) from 2020

TABLE 5 Comparing Construction Expenditures (Hard Costs), 2020 and 2021

Building Type	Expenditures	Expenditures	Change (2020-2021)
	(In Billions of Dollars) 2020 ¹	(In Billions of Dollars) 2021 ²	
Office	\$43.5	\$40.9	-5.9%
Industrial	15.5	28.2	81.3%
Warehouse	34.3	43.2	25.9%
Retail/Entertainment	12.3	13.3	8.3%
Total	\$105.6	\$125.6	18.9%

TABLE 6 Office, Industrial, Warehouse and Retail Construction, 2020 and 2021

Building Type	Square Feet (In Millions)		Construction Value ³ (In Billions of Dollars)	
	2020 ¹	2021 ²	2020 ¹	2021 ²
Office	117	100	\$43.5	\$40.9
Industrial	61	72	15.5	28.2
Warehouse	400	507	34.3	43.2
Retail/Entertainment	56	55	12.3	13.3
Total	635	733	\$105.6	\$125.6

Source: Dodge Data & Analytics.

¹ Revised.

² Trailing 12 months ending October 2021.

³ Hard costs only

to 2021, while retail construction value decreased only marginally (12% to 11%). In comparison, between 2020 and 2021, manufacturing construction expenditures increased as a percentage of the total from 15% to 22%, while warehouse construction remained steady, increasing from 32% to 34%.

Hard Construction Expenditures (All Structures Combined), Multipliers and GDP. Applying national construction multipliers from IMPLAN yields the economic impact of this construction activity. The multipliers measure contribution to GDP (2.71), personal earnings final demand (0.94), and employment final demand (18.07 jobs supported per \$1 million).⁵

State-level direct spending and associated economic impacts for spending on preconstruction (soft costs), construction (site development and hard cost) and post-construction (operations) are included in the appendices. Note that individual state construction multipliers are generally smaller than the U.S.

multipliers. The state-level multipliers measure only the share of construction-related expenditures retained within the respective state economies. Construction-related spending flows that leak out of one state economy to other states (spill-over effects) are excluded from state totals but counted in national totals. States with smaller economies tend to retain smaller portions of construction-related spending benefits than larger states due to the local supply chain—fewer goods and services are available to be sourced. Thus, goods and services tend to be sourced from outside the states or regions (i.e., leakage).

The Bottom Line. The four phases of development tracked in this study make substantial contributions to U.S. GDP. Applying the latest IMPLAN and BEA multipliers shows that direct construction expenditures—soft costs, site development costs, hard costs, tenant improvements—of \$239.8 billion in 2021 resulted in a contribution of \$653 billion to U.S. GDP, generated \$231.5 billion in personal earnings and supported 4.3 million jobs, as presented below in Table 7.

TABLE 7

Office, Industrial, Warehouse and Retail Construction and Operations Contribution to the Economy, 2021

Development Phase	Direct Expenditures (In Billions of Dollars)	Total Economic Contribution to GDP ¹ (In Billions of Dollars)	Personal Earnings ² (In Billions of Dollars)	Jobs Supported ³
Development Phase	\$239.8	\$653.0	\$231.5	4,257,175
Soft Construction (Soft Costs)	34.1	95.4	38.9	540,606
Site Development ⁴	34.5	93.4	32.3	622,779
Hard Construction (Hard Costs)	125.6	340.5	117.6	2,268,999

¹ The total value of goods and services generated directly and indirectly as a result of construction and related expenditures within the U.S.

² The additional earnings (wages and salaries) generated from construction and related expenditures.

³ The jobs supported by the spending and re-spending of direct expenditures for all phases of development and operations.

⁴ Site development includes grading, infrastructure, parking, and landscaping.

⁵ Tenant improvements exclude furniture and equipment.

Note: See Appendices for state-level data.

⁵ The national nonresidential structures multiplier was sourced from IMPLAN. The state-level multipliers were sourced from the Bureau of Economic Analysis.

The U.S. Economy and Residential and Nonresidential Construction

The U.S. experienced the longest economic expansion on record from July 2009 to February 2020, lasting more than a decade after the Great Recession. This era ended in March 2020 when the COVID-19 pandemic sent the U.S. into a recession. The pandemic recession was deep and swift, leading to an economic calamity that resulted in structural shifts while accelerating other trends that were already underway. The National Bureau of Economic Research determined the recession lasted just two months (March and April 2020)—the shortest recession in modern U.S. history. Despite the brevity, the cut was deep—national GDP fell 9.1% year-over-year in Q2 2020 alone, and the U.S. shed 22.4 million jobs in March and April 2020. The economy is now firmly in a rebound—the U.S. GDP reached a new peak in Q2 2021 and is projected to grow 5.6% in 2021 and 4% in 2022, according to Consensus Forecasts. The U.S. added back 18.5 million jobs over the 19 months beginning in May 2020. While a jobs deficit remains (3.9 million jobs, 2.6% below peak), the U.S. is projected to recoup job losses in 2022. Initial jobless claims fell to the lowest level since 1969 (when the labor market was much smaller) and the unemployment rate dipped to 4.2% in November 2021. Employee personal income and personal consumption expenditures have rebounded to record-high levels.

To address the destructive economic impact of the pandemic recession, federal stimulus was arguably rolled out faster and to a greater magnitude than during any prior recession—the federal government has spent \$3.5 trillion on the COVID-19 response, of which \$1.15 trillion was routed through the Small Business Administration via the Paycheck Protection Program, Economic Injury Disaster Loans (EIDL) and other programs. Monetary policy increased liquidity through the recession—the Federal Reserve’s total assets increased from a pre-recession level of \$4 trillion to nearly \$8.7 trillion in late 2021. The Centers

for Disease Control (CDC) reported nearly 242 million people (72.8%) had received at least one dose of the COVID-19 vaccine by December 2021; fully vaccinated people totaled 204 million.⁶

Despite the tailwinds filling the economic sails, headwinds pose risks to the recovery. Among the risks, the most notable are COVID variants, worker shortages, interest rates, supply chain disruptions and the highest inflation in 30 years. Supply chain challenges and disruptions, along with labor shortages and the difficulty of obtaining materials, have fueled cost inflation in the construction industry. According to the Bureau of Labor Statistics’ Producer Price Index (PPI) data, costs for new nonresidential building construction were up 1.3% in 2020 and 12.4% in November 2021 year-over-year; new industrial building construction costs rose 2% in 2020 and 14.6% year-over-year in November 2021; and costs for new office building construction rose 1.2% in 2020 and 13.1% in November 2021. Inputs to construction industries overall were up 5.5% in 2020 and rose 20.1% in November 2021 year-over-year; November 2021 year-over-year increases were observed in goods (23.5%), energy (76.4%), and services (15.1%). Inputs to new nonresidential construction increased more in November 2021 year-over-year (up 22.1%) compared to new residential construction (17.3%). Prices of specific inputs to construction observed large increases, with steel mill products up 141.6% year-over-year in November 2021; lumber and plywood up 12.2%; cement up 4.8%; and construction machinery and equipment up 9.1%, to name a few.

The recession and the recovery have varied widely by industry. While every industry lost jobs from February to April 2020, Financial Activities decreased 3.1% compared to a loss of 48.6% for Leisure and Hospitality. By November 2021, Financial Activities was above the pre-recession peak, while Leisure and Hospitality remained down 7.9% (see Figure 3 on page 11).

FIGURE 3: U.S. EMPLOYMENT BY INDUSTRY, CHANGE FROM FEBRUARY 2020 TO NOVEMBER 2021 (THOUSANDS OF JOBS)

Source: Bureau of Labor Statistics, CES (seasonally adjusted).

Residential building construction spending has grown each year from 2012 through 2018. Spending pulled back slightly (1.9%) in 2019, prior to the pandemic, but surged 15.3% in 2020. Activity continued into 2021, growing 23.8% year-to-date through October—the highest year-to-date value in the 20-year history of the series.

Nonresidential building construction expenditures increased 18.9% in 2021 but remained 6.9% below 2019 levels. Technology, demographics and COVID are having profound cyclical and “secular” impacts on commercial real estate property types. Cyclical impacts such as shifting to the work-from-home models may be temporary in their current form but very likely will lead to long-term (secular) changes in office demand, use and even design. Demographic changes include a growing number of Generation Z and millennial workers and a future where women dominate the ranks of college-educated workers. Technologies, ranging from the efficiency of e-commerce to artificial intelligence disrupting traditional service sector industries, have already transformed the retail, industrial, office and warehouse property cohorts. These are just a few of the many interconnected disruptions and transformations dramatically challenging historical trends in commercial real estate.

FIGURE 4: TOTAL VALUE OF CONSTRUCTION BY TYPE, 2011-2021 (IN BILLIONS OF DOLLARS)

Source: Dodge Data & Analytics.

Note: 2021 reflects the trailing 12 months through October 2021.

Offices: Launch Pad to Landing Pad

Office building construction outlays decreased for two consecutive years, falling 21.1% in 2020 and an estimated 5.9% in 2021 (Figure 4). While the value of construction fell 5.9% in 2021, the square footage of started new construction decreased 14.5%, illustrating the upward price pressure on office construction.

Office buildings have historically been the launch pad of new ideas and service-heavy production. The sector has seen a 20th-century evolution from wide open pools of desks to vast seas of cubicles and then shifts to collective shared collaboration zones and booth-like hoteling hotspots, all in the name of intellectual productivity. The realization that many routine tasks could be completed more effectively by remote work, albeit significantly enabled by technology, not only disrupted coworking models (lack of demand in the early days of the pandemic, followed by a surge in demand as companies sought to redefine their future space needs), but also cast the long-term viability of dense workspaces into question. The rationalization of office space use and layout (providing appropriate social distancing while still encouraging coworking opportunities) will be a major trend dominating the sector for years to come. Labor shortages have played into the equation as firms compete for talent with various forms of “amenitization” (i.e., worker socializing spaces, food, laundry, pet services, daycare) to attract new workforce entrants and retain existing talent. Out are kegs and pool tables and in are access to fresh air and services. New workers have voiced a preference for work-life balance and greater flexibility. Baby boomers who never considered working outside of an office are now re-evaluating the work-life benefits of working remotely.

A focus on healthy buildings (WELL certification) has begun to eclipse sustainability (LEED certification) as a hook to attract worker talent. A further trend is the reassessment of suburban vs. urban office demand. Having a landing pad for brief face-to-face staff and/or client meetings, near to where decision makers live, now has greater appeal than the historical trek to the downtown office building. Such changes may create opportunities to change rent models, lease terms and buildouts. As firms ponder their future space needs, largely around talent acquisition, rents for top-tier space

in Manhattan have reached records highs. At the same time, absent a clear strategy, Class B and even Class A-office space has languished, with rising official vacancy rates and even lower actual occupancy rates.

Not all suburban markets are the same, however. In high-growth markets driven by technology firms, for example, rents and prices have soared, even if space is yet to be occupied. Class B suburban office has suffered but may see new life in alternative uses, such as distribution or flex office/industrial space.

Behavioral changes such as the wide acceptance of flexible working arrangements, a heightened consciousness around hygiene, surfaces and physical distance, and a desire for community and connection stand to alter the office space environment permanently. Employees have largely become accustomed to the flexibility that remote work has provided, and while a switch to full-time remote work is unlikely for most office jobs, a move back toward full-time in-person work is also unlikely. In the Workforce Sentiment Survey conducted by CBRE in 2020, 85% of respondents said they would prefer to work remotely at least two to three days a week in the future, and 60% said they will return to the office in the future for community and collaboration.⁷ Employers are taking notice, and ones with the ability to do so will offer flexible or hybrid arrangements. In CBRE's 2021 U.S. Occupier Sentiment Survey, 87% of companies with 10,000 or more employees say they will be adopting hybrid work.⁸ Not only will this affect office utilization in major market areas, but it also stands to disrupt retail space around these office locations due to a decrease in work-related traffic.

Retail: Where's the Mall?

Retail building construction activity (including restaurants) peaked in 2016 and declined 42% by 2020, according to data from Dodge Data & Analytics (Figure 4). While the industry grew 8.3% from 2020 to 2021, these two years represent the lowest level of retail starts since 2010. Rather than the demise of retail, the sector is experiencing a metamorphosis as traditional ways of shopping have been overshadowed by new formats. E-commerce soared during the pandemic, and top-performing malls are being reinvented as experiential destinations. Similarly, grocery stores and service-heavy retailers such as food and beverage outlets have done well and are expected to continue to do so. Restaurants have been more constrained by labor supply than consumer demand. The distribution of commodities to consumers has indeed shifted from traditional brick-and-mortar stores to a growing share of online purchases.

While online sales may only account for around 15% of total retail sales, that share is growing. However, retailers have caught on to the power of omnichannel retailing, where online sales are significantly increased when a retailer has a proximate physical store. This has manifested itself in the form of online retailers opening physical stores, occupying less space than perhaps otherwise and with less onsite inventory, but serving the consumer's desire to touch and try before they buy. Also, by serving as both product-return and BOPIS (buy online, pick up in store) centers, these stores typically capture incremental sales on each visit. From a real estate perspective, traditional retail has suffered, resulting in higher vacancies, lower values and even reductions in supply. Some of that square footage is offset by expanded consumer-product distribution centers, such as Amazon's warehouses. Some is also being repurposed with mixed-use footprints, which generally include some form of retail. Newly built retail is adjusting to the new paradigm, incorporating efficient access to the property for shoppers and shippers, selling spaces

adapted to be more “showroom” than “sales floor,” and rethinking tenant mixes to embrace more internet-proof services such as food, health services, gyms, etc.

Industrial and Warehouse Attract Investment

Construction spending for **manufacturing buildings** increased 81.3% in 2021, with the additional square footage posting the highest gains in three years.

Warehouse building remains an area of strength in the construction industry, with valuations and space recording uninterrupted consecutive years of growth during the past decade. Annual production of warehouse space increased 702% during the past decade, and values increased 783% (Figure 4). Even over the very short term, warehouse has outperformed the broader construction industry, with values growing 25.9% and area up 26.6% during the past year.

Industrial properties have been the darlings of late in the real estate sector. Sales, leasing and pricing metrics have all risen to well above pre-COVID ranges. Their relatively low cost of development has made them pencil as attractive investments. Longer term, however, shifts in production sourcing and supply-chain accommodations could result in too much of the wrong product in the wrong place. The industry has seen this before; materials and labor cost swings, trade flows and transportation-mode shifts render once-ideal locations obsolete. In the near term, the pursuit of last-mile collection and distribution centers, close to the end users, will keep warehouse demand and usage strong, while emerging technologies such as biotech and alternative energy will support demand for modern manufacturing facilities. Likewise, a strong dollar and pent-up consumer demand will buttress the sector in the nation's major port markets.

Record consumer demand, combined with the shifting of consumer spending from services to goods as services, came to a halt in 2020 due to COVID-19, and the continued growth in e-commerce has driven strong demand for warehouse space. This has led to record-low vacancy rates and continued high demand for warehouse construction. Warehouse construction expenditures increased 25.9% in 2021 year-over-year, and the vacancy rate for the U.S. industrial market stood at a record-low 3.6% in Q3 2021, according to CBRE. Warehousing vacancy rates are even lower in major port markets, and there is not enough supply to meet demand. This has contributed to the supply chain disruptions that have been observed during the past year. In response, the development pipeline for the industrial market is at record levels, but

demand continues to outpace supply. CBRE estimates that every \$1 billion increase in online sales equates to the need for an additional 1 million square feet of warehouse space.⁹

Construction employment peaked in February 2020 at 7.6 million jobs (seasonally adjusted), with unemployment standing at 4.7% (unadjusted) in November 2021 compared to the unadjusted U.S. unemployment rate of 3.7% for the same month. The pandemic recession’s impact on construction labor was comparatively lighter than the Great Recession’s impact. While the Great Recession led to a loss of 2.3 million construction jobs (-29.7%), the pandemic recession resulted in a loss of 1.1 million construction jobs (-14.6%). It took nearly five years for industry employment to reach bottom during the Great Recession; construction industry employment has nearly recovered from the pandemic recession (down 1.5% as of November 2021; see Figure 5).

Conclusion

Total construction spending was up an estimated 6.3% in 2021 and accounted for approximately 18.3% of total GDP. The continued demand for new

construction throughout the pandemic has positively impacted the economy. The demand for construction inputs—from design services to construction goods and labor—meant that the industry was a catalyst for the economic recovery. The industry continues to lead the overall U.S. economic recovery from the pandemic recession. The subsector of nonresidential construction has underperformed the industry, decreasing 1.2% in 2020 and 6.5% year-to-date in October 2021. This illustrates the struggles for some segments of the economy resulting from the pandemic.

As the downstream industry end-users of commercial space heal, so will demand for new construction. Nationally, commercial real estate appears to be near equilibrium, but there are imbalances in some product types (e.g., industrial) in some areas of the country (e.g., Southern California). While COVID-19, workforce constraints, inflation, interest rates and supply chain issues will pose challenges to the commercial real estate industry in 2022, strong growth in real (inflation-adjusted) GDP (4%), led by even stronger growth in nonresidential fixed business investment (5.3%), are evidence of continued rebounding demand for construction and real estate.¹⁰

Jobs Housed and Payroll Value

In addition to the annual operating expenditures associated with new building space, these structures represent new productive capacity within the national economy. While the value of this added capacity depends on how each building is used, two common measures are the number of jobs this new capacity can accommodate and the amount of payroll these new jobs can potentially generate. Using an average-jobs-per-square-foot estimate for each category of building, it is possible to estimate the total number of employees who could be housed within the buildings built in 2021. The total payroll value of these new workers also can be calculated by multiplying this

employment estimate by the 2021 U.S. average wage earnings per worker for the mix of jobs associated with each building category.

These calculations are presented in Table 10. They show that the 733 million square feet of new office, industrial, warehouse and retail space constructed in 2021 has the capacity to house 1.6 million new workers with a total estimated annual payroll of \$113 billion. The jobs per square feet are based on historical data prior to the pandemic. The utilization of space was likely altered due to behavioral changes related to the pandemic, ranging from remote work to online shopping.

TABLE 10

Jobs Accommodated and Payroll Generated in Office, Industrial, Warehouse and Retail Space Construction in 2021

Building Type	Square Feet (In Millions)	Square Feet per Job	Jobs Accommodated (In Thousands)	Average Earnings per Job	Total Payroll (In Billions of Dollars)
Office	100	190	525	\$121,173	\$64
Industrial	72	750	96	\$74,518	\$7
Warehouse	507	600	844	\$45,055	\$38
Retail/Entertainment	55	475	116	\$37,969	\$4
Total/Average	733	464	1,581	\$71,592	\$113

Sources: Dodge Data & Analytics; U.S. Bureau of Labor Statistics (QCEW); Newmark; CU Leeds School of Business.

Note: For this study, office jobs were tabulated for the Information; Finance and Insurance; and Professional, Scientific and Technical Services industries. Industrial jobs included the Manufacturing industry; Warehouse jobs included the Warehouse industry; and Retail/Entertainment jobs included the Retail industry.

Note on Methodology

Construction Value and Area

For 2021, full-year construction values were estimated to publish the economic results in January 2022 so that NAIOP members would have current data to use during meetings with congressional representatives and local government.

The construction estimates (value and area) for 2021 were provided by Dodge Construction and Analytics. They were based on activity for the 12 months ending in October 2021 and revised annual construction totals for the preceding years.

Economic Multipliers

The output (GDP), personal earnings (wages and salaries) and jobs-supported multipliers used in the 2021 report reflect the most recent revisions that the U.S. Department of Commerce's Bureau of Economic Analysis (BEA) and IMPLAN acquired in December 2021. These multipliers are based on the 2012 Benchmark Input-Output Table for the nation and 2019 regional data.

Multipliers by state were sourced from the Bureau of Economic Analysis (RIMS II) for three industries: construction (nonresidential structures), soft costs (Architectural, Engineering and Related Services) and operations (Services to Building and Dwellings). The aggregated national multipliers were sourced from IMPLAN.

- **Construction** multipliers are utilized for hard costs, site improvements and tenant improvements.
- **Architectural and engineering services** multipliers are utilized to represent the bundle of construction-related professional services considered in this report and identified as soft costs (preconstruction).
- **Services to buildings** multipliers are utilized to represent the bundle of building operations services (including building management, repair and maintenance, custodial, security, and sales and marketing, but excluding local taxes and finances costs).

Other

Building maintenance costs were estimated using the per square foot costs from the prior report and grown at the rate of inflation using the Bureau of Labor Statistics, Consumer Price Index (CPI) for All Urban Consumers (CPI-U), U.S. City Average.

Survey of NAIOP Members

Since 2006, NAIOP has conducted member surveys to determine the distribution of construction costs across the four major categories of building development—soft costs, site development, hard costs and tenant improvements—by type of building. The results of these surveys are shown in Table 11.

TABLE 11

**Survey of NAIOP Members' Building Cost Allocation Percentages (%),
by Building Type 2006, 2008, 2013, 2016, 2018, 2021**

Building Type	Soft Construction Costs ¹	Site Development Costs	Building Construction Costs	Tenant Improvement Costs
Office				
2021	15.1%	10.2%	53.0%	21.8%
2018	18.1	11.6	52.4	17.9
2016	16.4	13.7	49.2	20.6
2013	14.4	14.5	49.5	21.6
2008	17.4	14.2	49.7	18.6
2006	17.1	15.8	49.5	17.6
Manufacturing				
2021	12.6	13.8	51.0	22.7
2018	10.0	14.9	56.2	18.9
2016	12.3	9.4	57.1	21.3
2013	16.9	13.8	54.0	15.3
2008	14.3	19.3	52.6	13.8
2006	12.1	18.6	55.7	13.7
Warehouse/Flex				
2021	14.2	18.3	54.5	13.0
2018	14.7	17.5	54.9	12.9
2016	14.1	15.5	57.9	12.6
2013	14.6	19.0	53.3	13.1
2008	17.1	18.5	53.6	13.7
2006	14.2	16.8	55.0	14.1
Retail				
2021	15.3	15.9	47.6	21.3
2018	19.1	13.7	46.0	21.3
2016	17.7	14.4	49.3	18.6
2013	17.0	21.8	44.3	16.9
2008	15.8	20.8	47.0	16.4
2006	17.7	16.1	52.4	13.8
Combined²				
2021	14.3	15.6	53.1	17.1
2018	15.5	14.4	52.4	17.7
2016	15.4	14.2	53.2	17.2
2013	15.2	17.3	49.1	17.3
2008	15.6	17.2	51.2	15.9
2006	16.3	16.4	52.5	14.9

¹ Professional services and administrative and management processes required to support the construction project.

² Weighted average reflecting the numbers of responses by type.

Definitions

Area of Analysis — the geographic unit of analysis, normally a political unit, for which economic, demographic and fiscal information is reported.

Building Value — construction value would include hard costs (costs of the structure) and soft costs (management, architecture and engineering, legal fees, communications); the finished commercial value would reflect cash flow potential or current performance. Assessed valuation for tax purposes may be accepted as an appropriate substitute for actual market value.

Development Costs — includes all of the construction-related expenditures associated with developing a building, which include soft construction costs, site development costs, hard construction costs and tenant improvement expenditures.

Direct Expenditures — all spending in support of all phases of new construction required to deliver the final product as well as the operation phase (after the building delivers), including payroll of the workers directly involved and all nonpayroll spending for materials, management, overhead, utilities, equipment leasing or purchases for or by subcontractors, suppliers and vendors.

Economic Impact — the generation of new spending within a jurisdiction as a result of investing in and operating new economic activity; in this case, office, industrial, warehouse and retail buildings.

Fiscal Impact — the effect of real estate development on the revenues and expenditures of the jurisdiction where the building is located.

Gross Domestic Product (GDP), Gross State Product (GSP) — the value of goods and services produced within the economy of the respective geographic area (nation, state).

Gross Square Feet — a measure of an individual building size or aggregate inventory of building space reflecting the total envelope of the structure, which is typically larger than the occupied or usable building area.

Hard Construction Costs — a category of construction costs that reflects the expenditures for the building's hard construction phase. Costs for labor, materials and construction management are the three basic types of hard costs. Soft construction costs, site development costs and tenant improvement expenditures are reported independently from hard construction costs.

Indirect Benefit — the additional economic benefits (measured in dollars or jobs) resulting from the accumulated additional value generated by direct expenditures, as these dollars are re-spent within the economy. Indirect effects are calculated using **Multipliers** and include sales and purchases by businesses supplying goods and services in support of building construction and operation as well as the re-spending of payroll by workers (**Induced Effects**) associated with the new building.

Induced Effects — the contributions of the payroll spending by workers in a specific industry or sector on local businesses providing goods and services to households.

Infrastructure — utilities, roads, parking lots, storm drainage structures; other site improvements could be included in estimating these costs if not included elsewhere. If these improvements are financed by the private sector, whether on-site or off-site, their costs should be included in the base values for calculating industry economic contributions.

Interstate Spillovers — economic contributions that are generated by direct construction expenditures in a given state that are realized by another state due to workers commuting across state lines (i.e., earning wages in one state and spending these earnings in their home state) and the importation of building materials from another state. These economic impacts are not reflected in the benefiting states' multipliers but are captured in the U.S. multipliers and reported in the U.S. totals.

Multiplier — a number used to calculate the final economic impact of one dollar spent. Types of multipliers include:

output multiplier measures the contribution of a direct expenditure on the overall economy (gross domestic product or gross state product).

employment multiplier measures the total number of jobs that can be supported by a direct expenditure (expressed in jobs supported per \$1 million in direct spending).

personal earnings multiplier measures the total personal earnings (wages and salaries) generated within the state or nation as a result of a direct expenditure and the jobs it supports.

Operating Costs — costs (expenditures) associated with the day-to-day operation of an office, industrial, warehouse or retail building including building management, utilities, normal maintenance and repair, custodial services and security. These costs do not include the operating costs of building tenants.

Output — the goods and services produced for sale to other firms or industries as intermediate goods or services or for sale to consumers as final goods or services.

Personal Earnings — wages and salaries (payroll) paid out to all workers related directly or indirectly to the construction activity (pre-construction, construction, post-construction) for which direct expenditures are made. These wages and salaries include payment to the workers directly related to construction work being performed, employees of suppliers and vendors related to that work, and employees of businesses and organizations benefiting from the spending of these new wages and salaries generated as a result of these direct expenditures; that is, employees working in retail and consumer services, health care, education, local government and so on, whose business sales and cash flow have increased because of the new wages and salaries paid to workers in construction-related activities.

Sector — industries or firms grouped by similar characteristics of operations (e.g., retail trade sector, manufacturing sector, construction sector, services sector, government sector, etc.).

Site Development — a category of construction costs that reflects improvements made to the site before a building can be constructed. These costs include grading, infrastructure, landscaping, surface and structured parking, and other costs to prepare the site to support the functions of the building constructed on the site.

Soft Construction Costs — a category of development costs that reflects the professional services and administrative and management processes required to support the construction project. These may precede actual on-site construction by several years and may include legal and other consultant services, architectural and engineering services, management and administration.

Tenant Improvement Costs — a category of construction costs that reflects improvements made to the interior of a building to meet the needs of a specific tenant. Costs may include interior walls and partitions, floor coverings and cabinets, but excludes furnishings. The building owner or the tenant may pay for these improvements.

Total Output — the sum of the direct and indirect benefits (expenditures) reflecting the combination of the initial expenditures by a firm and its subsequent accumulated value as this spending is recirculated throughout the economy. This includes benefits (induced) generated by the re-spending of personal earnings. This represents the total contribution to gross domestic product or gross state product.

Value Added — a measure of the incremental dollar value created by an industry, firm or individual employee as a result of its production process (work performed); the value created beyond the value of the individual inputs.
